

Quantum Energy Transfer

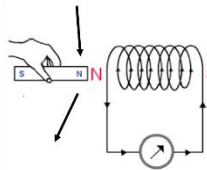

By Gary Tripp

June 2018

The transfer of energy from the Quantum Field to the Physical Field happens all the time. It is just not well recognized for what it is, because we are mentally locked in our three dimensional world of gears and levers.

When Sunlight heats the earth or strikes a solar cell and creates electricity, it does work by transferring energy from the Quantum Field of electromagnetism to the Physical Field. When Earth's gravity changes the course of meteorite, it does work and by transferring energy from the Quantum Field to the Physical Field. When a radioactive particle from Uranium strikes water and heats it, or strikes X-ray film and creates an image, it does work by transferring energy from the Quantum Field to the Physical Field. When a magnet approaches a coil of copper wire, it causes electrons (electricity) to flow in the wires and does work by transferring energy from the Quantum Field to the Physical Field.

This transfer of energy from the Quantum Field to the Physical Field caused by an approaching magnet is the source of the energy transfer that Infinity SAV USA's generator uses to create electricity.

When the magnet approaches a coil of copper wire it induces the flow of electrons and creates a like polarity. North induces a North polarity and North repels North and that is the motive force for the generator rotation.

Magnets that do work, transfer (1%) of their Quantum energy every 10 years to the physical work being done. But because the energy represented by an electron orbital position is so great, it does appear as if the energy is just appearing magically out of nowhere. I have often said Magnets are the bridge between the Quantum world of infinite energy and the Physical world of limited energy.
